#### NOVELTY (N) and INVENTIVE STEP (IS) claims 1 - 14

The invention defined in claims 1 - 14 is novel and contains an inventive step in light of documents D1 - D7. The documents cited in the associated International Search Report, documents D1 - D7, do not clearly disclose a method for transforming a digital signal from the time domain into the frequency domain and vice versa using a transformation function comprising a transformation matrix, the digital signal comprising data symbols which are grouped into a plurality of blocks, each block comprising a predefined number of data symbols, the method comprising:

Transforming two blocks of the digital signal by one transforming element, wherein the transforming element corresponds to a block-diagonal matrix comprising two sub-matrices, wherein each sub-matrix comprises the transformation matrix and the transforming element comprises a plurality of lifting stages and wherein each lifting stage comprises the processing of blocks of the digital signal by an auxiliary transformation and by a rounding unit.

#### INDUSTRIAL APPLICABILITY (IA)

The claimed invention finds use in the field of digital signal transformation and clearly meets the requirements of industrial applicability.

Box No. VIII Certain observations on the international application						
The following observations on the clarity of the claims, description, and drawings or on the question whether the claims are fully supported by the description, are made:						
1. Claim 7 is not clear because the term "each sub-block", on page 35 line 20, has not been previously defined within the claim.
